

# Real-world configurations

If you happen to have any shareable part of your node config, it'd be nice to link it here!

## Akkoma

srxl (posting.isincredibly.gay)

Hosted on NixOS. includes Akkoma and Caddy. Phanpy is also included, but is not well tested. Restic is used for backups.

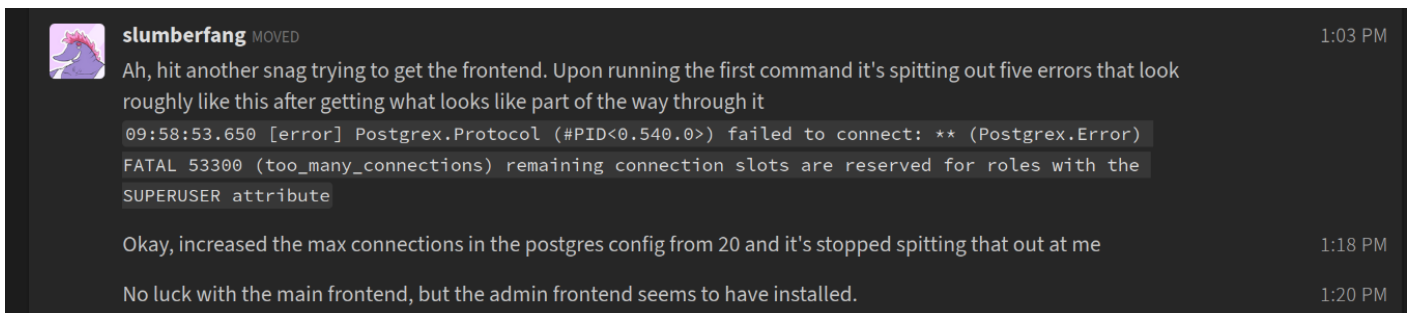

<https://git.isincredibly.gay/srxl/posting.isincredibly.gay>

slumberfang (tbd)

notes in coordination:

<https://coordination.websiteleague.org/#narrow/stream/20-Instance-Operators'-Helpdesk/topic/Issues.20with.20postgres.20.28plus.20other.20node.20setup.20issues.29/near/11651>

notably, he had to increase the postgres connection limit for initial Akkoma setup

The screenshot shows a chat message from a user named 'slumberfang' (profile picture of a unicorn). The message text is: 'Ah, hit another snag trying to get the frontend. Upon running the first command it's spitting out five errors that look roughly like this after getting what looks like part of the way through it' followed by a code block containing a PostgreSQL error: '09:58:53.650 [error] Postgres.Protocol (#PID<0.540.0>) failed to connect: \*\* (Postgres.Error) FATAL 53300 (too\_many\_connections) remaining connection slots are reserved for roles with the SUPERUSER attribute'. Below the code block, the user says: 'Okay, increased the max connections in the postgres config from 20 and it's stopped spitting that out at me' and 'No luck with the main frontend, but the admin frontend seems to have installed.' The chat interface shows the message was sent at 1:03 PM, 1:18 PM, and 1:20 PM.

ultimately landing on 50.
